# OG & E Geothermal Heat Pump Project: Objectives & Scope

- Evaluate Advances in Borehole heat exchanger designs
  - Newly installed heat exchangers will be evaluated relative to existing single U-tube heat exchangers
  - Thermally enhanced grouts
  - Borehole depth of 400 ft per home
  - Coupled to a 2-ton heat pump unit (ClimateMaster Tranquility 27® Model 038, Part Load) in each home
  
- Evaluate State-of-the-Art Drilling and Grouting methods
  - Commercially available grouts established in the market place
  - Pre-qualified for the study
  - Two-step thermally enhanced grouts vs one-bag grouts
  
- Installation of new ground heat exchangers and related instrumentation occurred in April and May 2011

January 2010

# Field Support and Grout Evaluation

- Two enhanced grouts based on thermal conductivity (BTU/hr/ft/F)
  - BAROTHERM GOLD 1.0
  - BAROTHERM MAX 1.6
- Project Design and Field Support
  - Six holes drilled & grouted for comparison
    - Field samples of grout thermal conductivity
    - Relative invasion (caliper log)
    - Mixed grout quartz sand content
- Other factors recorded for evaluation of system performance (discussed elsewhere by other contributors)
  - Hole diameter
  - Loop type
  - Tremie line diameter
  - Borehole resistance

January 2010

# Grout Thermal Specifications

- Two grouts selected
- High Thermal Conductivity
  - 1.6 BTU/hr/ft/F
  - Graphite thermal conductivity enhancement
- Standard Thermal Conductivity
  - 1.0 BTU/hr/ft/F
  - Quartz sand thermal conductivity enhancement

January 2010

# Important Aspects of Thermal Conductivity in the Industry

- Critical specification for most work
- Several ASTM tests for conductivity measurement
- Needle probe adopted by the industry:  
ASTM D 5334-08
- Responsibility falls to suppliers/distributors
  - Rare budget for testing after initial qualification
- General lack of consensus of field QA/QC

January 2010

“For External Distribution. © 2010 Halliburton. All Rights Reserved.”

# Needle Probe Method

- ASTM D 5334-08
  - “Determination of Thermal Conductivity of Soil and Soft Rock by Thermal Needle Probe”
  - IGSPHA adopted method (Standard 2B.1.2.1)
- Infinite line heat source
- Calculated from power, temperature, time and distance (6-in. probe)
- Limitations
  - Manual data interpretation; user-dependent variability
  - **Published sensitivity by ASTM is +/- 15%**

January 2010

“For External Distribution. © 2010 Halliburton. All Rights Reserved.”

# Custom needle probe apparatus

## ASTM D 5334-08

- Relatively simple modular system
- Consists of probe detector
- Power supply
- Lap top computer & software

January 2010

# Factors Impacting ASTM D 5334-08 Data in the Geothermal Market

- Conductivity is always a specification for a job
- The range of “error” is not understood
  - For example, a 0.90 BTU/hr/ft/F is statistically the same as a 1.0 BTU/hr/ft/F result
- Small deviations from a prescribed blend of sand, clay, and water lead to potentially big problems with qualifying a grout
- Small deficiencies in quartz content lead to problems in grout qualification

# Thermal Conductivity of the Components

| <b>Material</b> | <b>Thermal Conductivity<br/>(Btu/hr ft °F)</b> |
|-----------------|------------------------------------------------|
| Water           | 0.33*                                          |
| Bentonite       | 0.38-0.43                                      |
| Sand            | 1.16 – 2.31*                                   |

\*[http://www.engineeringtoolbox.com/thermal-conductivity-d\\_429.html](http://www.engineeringtoolbox.com/thermal-conductivity-d_429.html); Sand numbers are for sand saturated with water

# Why is the Silica Content Important?

- Silica content (quartz sand) IS the ingredient that “enhances” the thermal conductivity of these grout types
- Anything that decreases its required content in these grouts reduces the conductivity
- Silica in the form of the mineral quartz (quartz sand)
- Sand for two step grouts should have a silica (quartz) content of  $\geq 99\%$
- Contaminants impact mixing, pumpability, equipment wear, and conductivity measurements
- Water (moisture) can become a contaminant
  - too much water absorbed by the bentonite and the thermal conductivity decreases

# Common Examples of Sand Contamination

- Clays in the sand – increased viscosity leads to difficulty in mixing & pumping
  - Organic matter – thins the gel strengths and impairs the grout set
  - Calcite – impacts make-up water chemistry
  - Feldspars – lowers the thermal conductivity
  - Unknown extraneous material –What exactly is the thermal conductivity of a frog?
- \*\* these components even at relatively low levels have the tendency to lower the thermal conductivity and impact the pumpability of the grout

# Sand Content of Field Mixed Grouts

| Sample | Container | Sand Content (%) | Grout              |
|--------|-----------|------------------|--------------------|
| TC73   | Bucket    | na               | Barotherm Max      |
| TC74   | Bucket    | na               | Barotherm Max      |
| TC75   | Bucket    | na               | Barotherm Max      |
| TC76   | Bucket    | 50.45            | Barotherm Gold 1.0 |
| TC77   | Bucket    | 54.95            | Barotherm Gold 1.0 |
| TC78   | Bucket    | 51.39            | Barotherm Gold 1.0 |
| TC86   | Bucket    | 50.92            | Barotherm Gold 1.0 |
| TC87   | Bucket    | 49.57            | Barotherm Gold 1.0 |
| TC100  | Standard  | 51.50            | Barotherm Gold 1.0 |
| TC101  | Standard  | -                | Cuttings           |
| TC102  | Standard  | -                | Cuttings           |
|        |           |                  |                    |
|        |           |                  |                    |

**Bucket Size H=12" D=9"**

# Comparison of Fluid Invasion, Thermal Conductivity and Sand Content

| 83 <sup>rd</sup> St -                      | 932  | 928  | 813  | 833   | 925  | 944  |
|--------------------------------------------|------|------|------|-------|------|------|
| Relative Invasion**                        | 1    | 6    | 2    | 4     | 5    | 3    |
| Thermal Cond. (field sample) (BTU ft hr F) | 2.78 | 0.81 | 0.85 | 2.90* | 0.92 | 0.90 |
| Sand Content (wt%)                         | n.a. | 50.5 | 49.6 | n.a.  | 55.0 | 51.4 |

\* Average of duplicate set

\*\* Relative Invasion: 1 highest, 6 lowest

925 83<sup>rd</sup> St: lowest invasion, best sand content, closest conductivity agreement to qualified grout

# Indications From the Work

- Many factors control the performance of enhanced grouts
  - Stratigraphy/local geology
  - Mixing precision of grouts and water
  - Pumping and delivery equipment
  - Complex problems requiring more field work to refine the protocol
- Certainly sand content and fluid invasion are important
  - Proper drilling fluid design and use is required
- Sound science requires standardized procedures
  - Recognize thermal conductivity test is sensitive among even the best of labs
  - Recognize that the industry will require specified equipment too
  - Recognize that the costs of a successful geothermal hole is not the same as a water well
